

Duet

User 1 Controls the Speaker that's closest to user 2, and vice-versa for user 2.

A two person musical device to explore what can be accomplished through collaboration, at least within music, but the idea is for the user to extrapolate the experience into the greater outside world at large.

Controller:

The Music Within

Driven by ESP32 or Raspberry Pi (ideally Pi)

- Grab a sample of ambient room sound
 - Use that to determine the key of experience
 - An ambient loop starts playing
- Heart beat sensor attached to user
 - Will emphasize the volume of the loop according to the EKG reading
- Force-sensitive resistor:
 - Makes the heartbeat pulse effect stronger the harder you press on it
- X/Y touchpad

(Maybe) Have a screen or LED matrix to visualize the sound. Make it more intense the more reverb is playing?
